Assignment-2.5---Accessible-Profile-Images-and-Media

1. Why is `<img src="developer.jpg">` incomplete for a meaningful image?

It has no `alt` attribute, so screen readers can't describe the image (they may read out the file name instead), and nothing shows if the image fails to load. It's also invalid HTML.

2. Why is `alt="image"` usually poor alternative text?

Screen readers already announce that it's an image, so "image" adds nothing. It doesn't say what the image shows, so the user misses the information a sighted person gets.

3. What alt text would you write for your profile image, and why?

`alt="Portrait of Your Name smiling at the camera, wearing a blue shirt"`

It says who is shown and describes the visible details that matter, in one short, easy-to-listen-to sentence. Change it to match your actual photo.

4. When should `alt=""` be used?

For purely decorative images that add no information, like divider lines or icons beside text that says the same thing. The empty value tells screen readers to skip the image. Never use it for images that carry meaning, such as your profile photo.
